

Metazoan Parasites of Antarctic Fishes

Antarktik Balıkların Metazoon Parazitleri

ABSTRACT

To date, there have been nearly 100 papers published on metazoan parasites of Antarctic fishes, but there has not yet been any compilation of a species list of fish parasites for this large geographic area. Herein, we provide a list of all documented occurrences of monogenean, cestode, digenean, acanthocephalan, nematode, and hirudinean parasites of Antarctic fishes. The list includes nearly 250 parasite species found in 142 species of host fishes. It is likely that there are more species of fish parasites, which are yet to be documented from Antarctic waters. (*Türkiye Parazitol Derg* 2015; 39: 174-8)

ÖZET

Bugüne kadar Antarktik balıklarının metazoan parazitleri konusunda yayınlanmış olan yaklaşık 100'e yakın yayın basılmış olmasına karşın, bu geniş coğrafi alan içinde yer alan balıklara ait parazitlerle ilgili derlenmiş bir tür listesi bulunmamaktadır. Biz bu çalışmada da Antarktik balıklarının; Monogenea, Cestoda, Digenea, Acanthocephala, Nematoda ve Hirudinea türlerinin bir listesini derledik. Bu liste de konak balıkların 142 türlerde bulunan yaklaşık 250 parazit türü tespit edilmiş olup, Antarktik sularda bulunmasına karşın hala listede de yer almayan birçok parazit bulunması da muhtemeldir. (*Türkiye Parazitol Derg* 2015; 39: 174-8)

Anahtar Sözcükler: Metazoon, parazitler, Antarktik Bölge, deniz balıkları

INTRODUCTION

Antarctic waters are inhabited by approximately 197 known species of fishes (www.fishbase.org). Description of the Antarctic fish fauna was largely accomplished by the middle of the last century; however, description of the metazoan parasites of Antarctic fishes and documentation of their

occurrence in Antarctic waters lagged far behind. Most studies of fish parasites from Antarctic waters have been published within the last 40 years. To date (2010), there have been nearly 100 papers published on the metazoan parasites of Antarctic fishes. Of these, over half have been authored by Dr. Krzysztof Zdzitowiecki of the Polish Academy of Sciences in Warsaw, Poland, and his colleagues. This

compilation would only be a fraction of its current size without his dedicated efforts to document and publish the accounts of the parasites of Antarctic fishes over many decades.

Our objective is to provide a list of all documented occurrences of monogenean, cestode, digenean, acanthocephalan, nematode, and hirudinean parasites of Antarctic fishes. We have relied on reports published in the peer-reviewed literature. We believe that this list will be useful to a wide variety of researchers in taxonomy, ecology, and evolution.

METHODS

To compile this list of metazoan parasites of fishes of Antarctic waters, we attempted to locate all published accounts. In the list, we included every documented occurrence of a parasite species, specified as the host species (if given), gave the specific location or area, and cited the paper where the record was located. We used the original species name even if it differed from the current name, and we acknowledge that some of the names have been synonymized or changed. We arranged the species according to the traditional taxonomic group (i.e., monogenea, cestodes, digenea); then, we arranged them alphabetically according to family, genus within family, and species within genus.

RESULTS AND CONCLUSION

We located 97 papers (published between 1936 and 2010) reporting occurrences or descriptions of the metazoan parasites

of fishes in Antarctic waters. Taxa reported included the following: 24 species, 10 genera, and 7 families of monogeneans; 73 species, 27 genera, and 12 families of cestodes; 87 species, 44 genera, and 10 families of digeneans; 20 species, 15 genera, and 3 families of nematodes; 27 species, 4 genera, and 3 families of acanthocephalans; and 18 species, 14 genera, and 1 family of hirudinean parasites (Table 1). These parasites were found in a total of approximately 142 species of host fishes. The fish species with the largest number of documented parasite species (>60 species of parasites) were *Dissostichus eleginoides*, *Notothenia coriiceps*, and *Notothenia rossii*. These fishes are abundant, and at least part of the number of parasite species documented for each fish species is likely to be a result of the large number of individuals examined.

This list may be incomplete because some species of Antarctic fishes have not been examined for parasites, and some fish species are represented by only a few occurrences. There are 197 fish species described from Antarctic waters, and metazoan parasites have been documented from approximately 142 of those species. Examination of other specimens of these same species and other fish species may yield more metazoan parasite species. Some of the parasite groups included here, such as monogeneans, are among the most host-specific parasites; therefore, examination of new potential host species may lead to the identification of new monogenean species. However, more studies still remains to be conducted.

Table 1. List of all published occurrences of metazoan parasites of fishes in Antarctic waters.
